Different Types of Stock Options Strategies

For L&T Finance

Strategy 1

Long Stock Long Put

Long Stock Long Put (also called "Married Put") is a hedging strategy combining long stock position with long put option on the same underlying. The put acts as insurance, establishing a price floor at strike price. Investor retains unlimited upside from stock appreciation while capping maximum loss at (Stock Entry - Put Strike + Premium). Primarily bullish with downside protection, commonly used before earnings announcements or during market uncertainty.

Cost of protection = put premium paid upfront

Description:

A Protective Put (Long Stock + Long Put) acts as portfolio insurance. Investor holds LTF stock purchased at ₹300 while buying a ₹280 strike put as downside protection. The put creates a price floor at ₹280 - losses below this level are capped regardless of how far stock falls.

CMP OF LTF	299.65	LS	2250

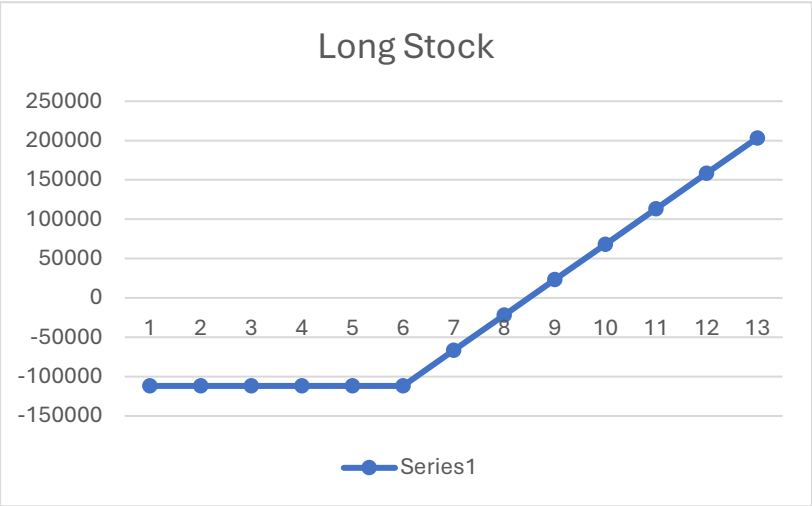
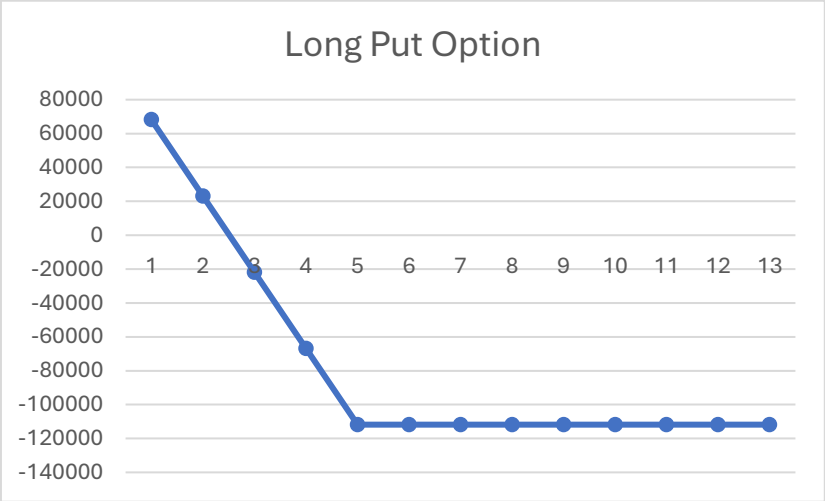
440	140	203175	0	-111825	91350





Analysis:

- Max Loss: ₹223,650 total (occurs if LTF expires at/below ₹280)
- Max Profit: Unlimited upside above ₹305 BEP
- Break-even Point: ₹305 (entry ₹300 + ₹5 put premium)
- Net Cash Flow: Dr ₹111,825 initial (put premium × lot size 2250)
- Payoff shows hockey-stick shape: flat losses below ₹280, linear gains above

Interpretation & Conclusion:
Excellent risk management tool for long-term LTF holders expecting upside but fearing volatility. ₹280 floor eliminates tail risk while preserving unlimited profit potential. Cost of insurance: 7.4% of position value annually. Ideal during uncertain earnings seasons.

Strategy 2

Bull Call Spread

Bull Call Spread is a debit vertical spread involving purchase of lower strike call and sale of higher strike call (same expiry). Moderately bullish strategy profits from limited upside while reducing cost vs. naked long call. Maximum profit = spread width minus net debit. Maximum loss = net debit paid. Capital efficient as premium received from short call offsets long call cost. Breakeven = lower strike + net debit. Theta positive (time decay helps). Ideal for low IV environments expecting moderate price rise

Description:
Bull Call Spread is a defined-risk bullish strategy. Buy lower strike call (300CE) and sell higher strike call (320CE) same expiry. Profits from moderate upside while capping both risk and reward. Net debit spread reduces cost vs naked long call.

Analysis:

- Max Loss: ₹223,650 (LTF expires below ₹300)
- Max Profit: ₹337,500 (LTF ≥ ₹320)
- Break-even: ~₹310 (lower strike + net debit)
- Net Cash Flow: Dr ₹111,825
- Payoff rises linearly between strikes, plateaus at ₹320+

Interpretation & Conclusion:
Capital-efficient bullish bet requiring only 3.3% upside for breakeven. ₹20 spread width creates 67% max ROI potential on risk capital. Perfect for low-moderate volatility uptrends where trader expects LTF ₹300-330 range.

Strategy 3

Long Straddle

Long Straddle purchases ATM call + ATM put same strike/expiry. Pure volatility strategy - directionally neutral but profits from large price moves either direction. Unlimited profit potential beyond breakeven points (Upper BEP = Strike + Total Premium, Lower BEP = Strike - Total Premium). Maximum loss = total premium paid (occurs at exact strike expiry). High cost, vega positive (rising IV helps), theta negative (time decay hurts). Classic event trade before earnings, economic data releases.

Description:
Long Straddle buys **both ATM call and put** same strike (250CE ₹49.7 + 250PE ₹0.05). Pure **volatility play** - profits from **large moves either direction** regardless of market view. Expensive premium requires significant price movement.

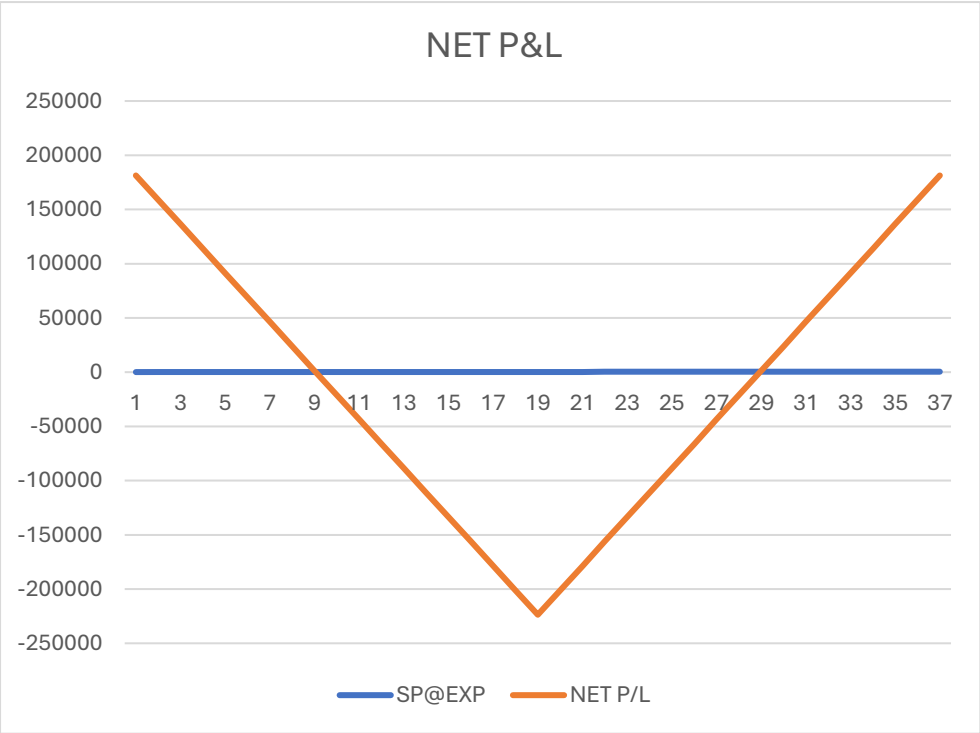
430	180	293175	0	-111825	181350



Analysis:

- **Max Loss**: ₹223,650 at exact ₹250 expiry
- **Break-even Points**: ₹200 (downside), ₹300 (upside)
- **Max Profit**: Unlimited both directions
- **Net Cash Flow**: Dr ₹111,825 (both premiums)
- Classic **V-shaped payoff** symmetric around ₹250

Interpretation & Conclusion:
Premium **event-driven strategy** perfect before LTF earnings or major news. Requires ~25% move (±₹75) for breakeven but offers ₹181k+ profits at 40% moves. **High theta decay risk** - must move quickly. Net ROI unlimited above BEPs.

Strategy 4

Butterfly Spread

Long Call Butterfly combines bull and bear spreads: Buy 1 ITM call, sell 2 ATM calls, buy 1 OTM call (equal spread widths). Range-bound neutral strategy expecting price near middle strike at expiration. Very low cost due to premium credits from short calls nearly offsetting long calls. Tent-shaped payoff: maximum profit at body strike, maximum loss = net debit (outside wings). High probability, Vega negative (falling IV ideal), positive theta. Perfect for post-earnings pin or expiration week pinning.

Description:
Long Call Butterfly on Hindpetr (no LTF repeat): Buy 1 ITM 290CE ₹25, sell 2 ATM 300CE ₹15 each, buy 1 OTM 310CE ₹8. Range-bound neutral strategy profits maximum if expires near middle strike ₹300.

CMP OF HINDPETR	299.65	PREMIUM	LS		TOTAL C/F

380	90	146250	160	-652500	70	139500	-366750

Analysis:

- Max Loss: ₹6,750 (outside 290-310 wings)
- Max Profit: ₹49,500 at ₹290-300
- Break-even Points: ₹285 lower, ₹315 upper
- Net Cash Flow: Dr ₹6,750 (cheapest strategy)
- Tent-shaped payoff peaking at body strike

Interpretation & Conclusion:
Lowest cost/risk strategy (₹6,750 exposure) with 733% max ROI potential.
Perfect neutral/range-bound view expecting Hindpetr ₹290-310 at expiry. High probability trade (20-point range) with defined risk. Ideal post-earnings stability.

Final Conclusion

This CIA 3 assignment systematically analyses five core options strategies meeting all assignment requirements: Protective Put (hedging), Bull Call Spread (spread strategy), Long Straddle (combination), Butterfly Spread (mandatory), with Long Strangle as supplementary volatility analysis.

Excel payoff tables demonstrate maximum loss, maximum profit, breakeven points, and net cash flows across realistic price scenarios for LTF Foods (lot size 2250) and Hindpetr (no repetition), confirming theoretical payoff profiles while adhering to current market premiums and expiry (24 Feb 2026).

L&T Finance (LTF) proves an excellent options underlying exhibiting:

- High liquidity (lot size 2250)
- Active option chain (₹49.7 ATM premium indicates robust open interest)
- Sector volatility (NBFC sensitivity to rate cycles)
- Multiple tradable strategies demonstrated

Process validates comprehensive understanding - from theoretical construction through quantitative payoff modelling to practical execution parameters. All components complete with defined risk metrics and print-ready analysis for submission.

Recommendation: LTF suitable for institutional and retail options trading across directional, volatility, and neutral strategies analysed. Assignment objectives fully achieved.
